

OpenSFS Project Lustre SMP Node Affinity

Liang.zhen@intel.com

Aug, 28 2012

Agenda

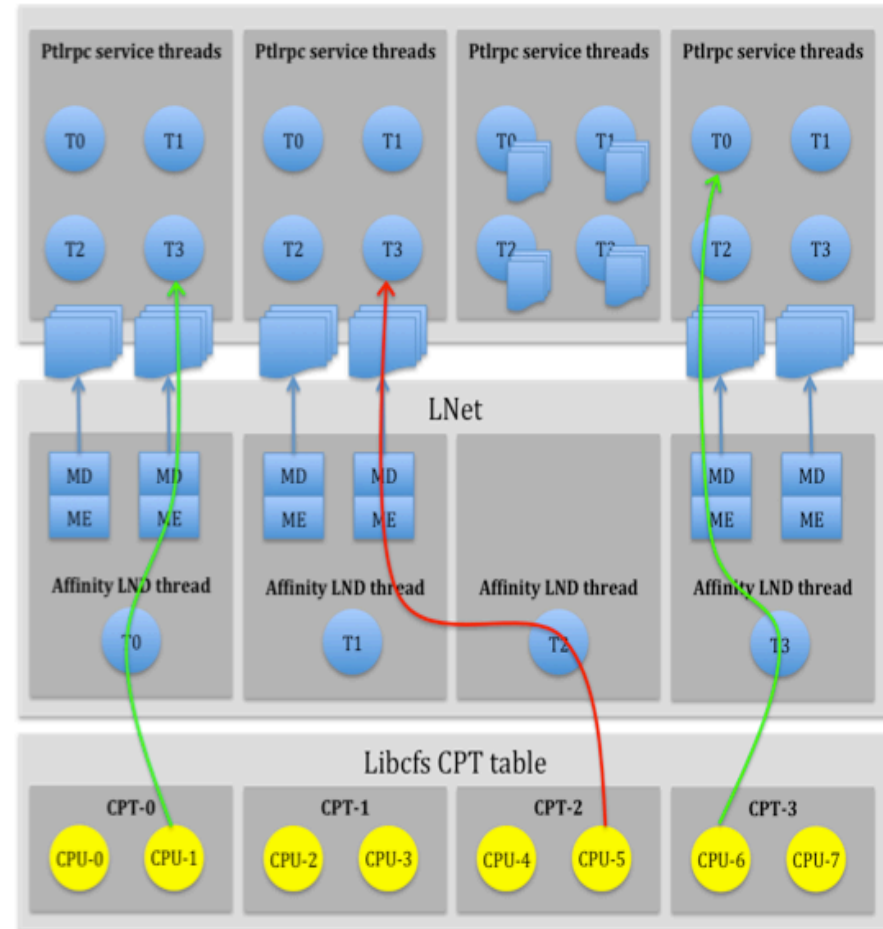

- Background
- Demonstration
- Tuning Lustre on SMP machine

Background

- Goal of this project
 - Improve SMP scalability of LNet
 - Improve metadata performance for single MDS
 - Funded by OpenSFS
- Code landed to 2.3
 - 16K+ LOC

Partitioned Lustre Server

- CPU Partition (CPT)
 - Similar to cpuset of linux
 - Can be easily used by kernel thread
- Partitioned LNet(LND)
 - LND thread-pool for each CPT
 - Core LNet has partition data
- Partitioned ptlrpc service
 - Ptlrpc service thread-pool for each CPT
 - Request-queue & wait-queue for each CPT

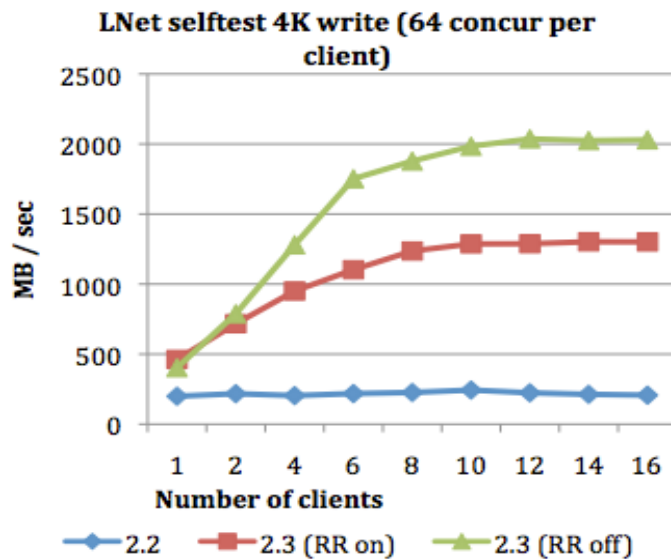

LNet performance tests

- Hardware
 - Server: 6-core CPU (2-HT), 2 sockets
 - Client: 4-core, 1 socket
 - QDR infiniband
- LNet selftest
 - Selftest ping
 - Selftest 4K read/write
 - Concurrency
- Portal Round-Robin (Portal RR)
 - NID affinity in LNet (LND)
 - Enable/disable NID affinity of incoming message for upper layer (ptlrpc service, or LNet selftest)

LNet performance

- 2.3 ping is 900% of 2.2 with Portal-RR OFF
- 2.3 ping is 600% of 2.2 with Portal-RR ON
- 2.3 4K-BRW is 600%-700% of 2.2 with Portal RR OFF
- 2.3 4K-BRW is 500% of 2.2 with Portal RR ON

mdtest

- Hardware
 - MDS
 - 6-core CPU (2-HT), 2 sockets
 - 8G SSD as MDT journal
 - OSS
 - 3 OSSs, 6 OSTs per OSS
 - Client: 4-core, 1 socket
 - QDR infiniband
- Mdtest patches
 - multi-mount
 - Simulate high work load with small number of clients
 - Disable mdc_rpc_lock can't help shared directory tests
 - 0-stripecount file
 - w/o OST object creation

File creation performance

- Iterate over 1,2, 6, 4, 8,10, 12,14, 16 clients
- Each client has 48 threads
- Each thread is running under a private mount
- 2.3 opencreate performance is 350%-400% of 2.2
- OST object pre-creation works pretty good
- Turning off PDO, shared directory opencreate performance of 2.3 is similar to 2.2

File unlink performance

- Iterate over 1,2, 6, 4, 8,10, 12,14, 16 clients
- Each client has 48 threads
- Each thread is running under a private mount
- 2.3 unlink performance is 150%-300% of 2.2
- Client needs to send RPC to destroy each OST object
- Turning off PDO, shared directory opencreate performance of 2.3 is even worse than 2.2

File stat performance

- Iterate over 1,2, 6, 4, 8,10, 12,14, 16 clients
- Each client has 48 threads
- Each thread is running under a private mount
- 2.3 stat performance is 200%-400% of 2.2
- Client needs to send RPC to stat each OST object

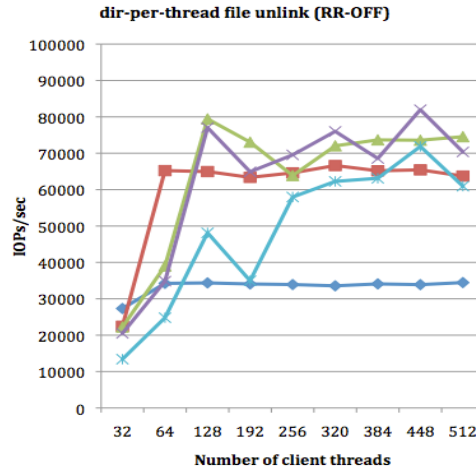

Performance of different CPT configurations

- MDS has 12 cores (24 HTs)
- 1 CPT
- 2 CPTs
 - Portal-RR ON
- 4 CPTs (default)
 - Portal-RR ON & OFF
 - 2 CPTs for LNet, 2 CPTs for ptlrpc service
 - 1 CPT for LNet, 3 CPTs for ptlrpc service
- 6 CPTs
 - Portal-RR ON & OFF
 - 2 CPTs for LNet, 4 CPTs for ptlrpc service
- 12 CPTs
 - Portal-RR ON & OFF

Performance of different CPT configurations

◆ 2.2
 ▲ 2.3 (4cpts, 4:4, rr-off)
 ◆ 2.3 (12cpts, 12:12, rr-off)
 ■ 2.3 (1cpt, 1:1)
 ✕ 2.3 (6cpts, 6:6, rr-off)

◆ 2.2
 ▲ 2.3 (4cpts, 4:4, rr-off)
 ◆ 2.3 (12cpts, 12:12, rr-off)
 ■ 2.3 (1cpt, 1:1)
 ✕ 2.3 (6cpts, 6:6, rr-off)

◆ 2.2
 ▲ 2.3 (4cpts, 4:4, rr-off)
 ◆ 2.3 (12cpts, 12:12, rr-off)
 ■ 2.3 (1cpt, 1:1)
 ✕ 2.3 (6cpts, 6:6, rr-off)

◆ 2.3 (2cpts, 2:2, rr-on)
 ▲ 2.3 (4cpts, 1:3)
 ◆ 2.3 (6cpts, 6:6, rr-on)
 ◆ 2.3 (12cpts, 12:12, rr-on)
 ■ 2.3 (4cpts, 4:4, rr-on)
 ✕ 2.3 (4cpts, 2:2)
 ● 2.3 (6cpts, 2:4)

◆ 2.3 (2cpts, 2:2, rr-on)
 ▲ 2.3 (4cpts, 1:3)
 ◆ 2.3 (6cpts, 6:6, rr-on)
 ◆ 2.3 (12cpts, 12:12, rr-on)
 ■ 2.3 (4cpts, 4:4, rr-on)
 ✕ 2.3 (4cpts, 2:2)
 ● 2.3 (6cpts, 2:4)

◆ 2.3 (2cpts, 2:2, rr-on)
 ▲ 2.3 (4cpts, 1:3)
 ◆ 2.3 (6cpts, 6:6, rr-on)
 ◆ 2.3 (12cpts, 12:12, rr-on)
 ■ 2.3 (4cpts, 4:4, rr-on)
 ✕ 2.3 (4cpts, 2:2)
 ● 2.3 (6cpts, 2:4)

Lustre SMP configurations (libcfs)

- Many chip types
 - Server-1: Dual-core CPU, 8 sockets
 - Server-2: 50 cores, 1 socket
 - Server-3: 4 sockets, 2 NUMA nodes
 - Server-4: 2 sockets, 4 NUMA nodes
- Default
 - Preferred value “N”
 - $2 * (N - 1)^2 < NCPUS \leq 2 * N^2$
 - Adjust “N” based on number of sockets or NUMA nodes
- Configure CPU partitions for libcfs
 - Libcfs `cpu_npartitions=NUMBER`
 - Prefer to put siblings in same CPT
 - Libcfs `cpu_pattern=STRING_PATTERN`
 - Example: `libcfs cpu_pattern="0[0-6/2] 1[1-7/2]"`
 - Example: `libcfs cpu_parttern="N 0[0,2] 1[1,3]"`

Lustre SMP configurations (LNet)

- NID affinity
 - Hash NID by default
 - Bind NI on CPTs
 - O2ib0(ib0)[0, 1], tcp(eth0)[2, 3]
- Credits
 - NI credits
 - Router buffer credits
- Portal Round-Robin
 - /proc/sys/lnet/portal_rotor
- LND threads number
 - Decrease default threads number
 - Add extra threads for multiple interfaces

Lustre SMP configurations (Lustre server & client)

- Bind service on CPTs
 - Both for MDS and OSS
- Use-cases
 - 32 cores machine, 4 sockets
 - Default
 - 4 partitions, LNet and ptlrpc services can run on all partitions
 - Config-1, one IB interface MDS
 - Lnet networks="o2ib0(ib0)[0]"
 - Mdt mdt_num_cpts="[1,2,3]"
 - Config-2, user only want to run Lustre client on one socket.
 - Libcfs cpu_pattern="0[0-31/4]"
 - Need some changes to set affinity for client threads

Thank You
