

- These two graphs are using the same environment of: [http://jira.whamcloud.com/secure/attachment/11805/opensfs\\_smp\\_demonstration.pdf](http://jira.whamcloud.com/secure/attachment/11805/opensfs_smp_demonstration.pdf)
- The difference is, this time we switched the role of MDS and OSS servers, so the CPU of MDS is AMD Opteron(tm) Processor 6128, which is a little slower but has 16 cores.
- The AMD server doesn't have fast storage device, so journal device is 4G ramdisk
- Only has 6 clients at most, each client still has 48 mounts
- Also have a few data points for 2.2
  - We can see 16-core (2.2) has worse performance than 8-core (2.2)
